

KC Race Centre: How to Change the Track Image

Detailed instructions for the Track button, including how to tell mobile code apart from laptop/desktop code.

Important: make a backup before you edit

1. Open your project in VS Code.
2. In the left file list, open src/NextRacePage.jsx.
3. Before changing anything, copy the whole file and save a backup somewhere safe. A simple backup name is NextRacePage-backup.jsx.
4. Only change the small href line shown in this guide. Do not move blocks of code around.

1. The two places that control the Track button

Your Race Centre page currently has two separate tool sections. This is why something can work on the laptop version but be wrong on the mobile version.

Mobile version

The mobile section is inside this comment in src/NextRacePage.jsx:

```
{/* Mobile-only Weather + Race Centre Tools */}
```

This section is used when the screen is small, such as your phone. The clue is the class name lg:hidden. That means: show this section on small screens, but hide it on large screens.

```
className="... lg:hidden"
```

Laptop / desktop version

The laptop/desktop section is lower down in the same file, inside this code:

```
className="hidden min-w-0 space-y-4 lg:block"
```

The clue is hidden ... lg:block. That means: hide this section on small screens, but show it on large screens such as laptop and desktop.

2. What was wrong in your file

Your mobile Track button was pointing to a different image file than your laptop/desktop Track button.

Version	Old / current path	What it means
Mobile Track button	/img/tracks/redbull.jpg	This was opening a different image.
Laptop Track button	/img/tracks/redbullring.jpg	This was opening the correct image.

To make mobile and laptop match, both Track buttons should point to the same track image file.

3. How to change the mobile Track image

1. Open src/NextRacePage.jsx.
2. Press Ctrl + F on your keyboard.
3. Search for Mobile-only Weather + Race Centre Tools.

4. A little below that comment, find the Track button. It starts with <a and has the text Track between the opening and closing tags.
5. Find the href line inside that Track button.
6. Change the path to the correct image file.
7. Save the file with Ctrl + S.
8. Run npm start and check the Race Centre page on mobile view.

Mobile Track button - corrected version

```
<a
  href="/img/tracks/redbullring.jpg"
  target="_blank"
  rel="noreferrer"
  className="..."
  title="Open track map"
>
  Track
</a>
```

4. How to change the laptop/desktop Track image

1. Stay in src/NextRacePage.jsx.
2. Press Ctrl + F.
3. Search for Race Centre Tools.
4. Look for the section that has hidden ... lg:block nearby. That is the laptop/desktop section.
5. Find the Track button inside that section.
6. Change the href path if needed.
7. Save the file.

Laptop/desktop Track button - example

```
<a
  href="/img/tracks/redbullring.jpg"
  target="_blank"
  rel="noreferrer"
  className="..."
  title="Open track map"
>
  Track
</a>
```

5. How to tell mobile code from laptop code

These Tailwind class names are the key. You do not need to fully understand Tailwind. Just use these clues.

Code clue	Plain English meaning	Usually controls
lg:hidden	Show on small screens. Hide on large screens.	Mobile / phone section
hidden ... lg:block	Hide on small screens. Show on large screens.	Laptop / desktop section
sm:	Applies starting at small screens and wider.	Minor spacing/text changes
md:	Applies starting at medium screens and wider.	Tablet/laptop layout changes
lg:	Applies starting at large screens and wider.	Laptop/desktop layout changes

6. Recommended image naming system

Use consistent file names so you do not have to guess later. The image file must be inside the public folder of your React project.

Recommended folder

public/img/tracks/

Recommended examples

redbullring.jpg
silverstone.jpg
monza.jpg
spa.jpg
miami.jpg
montreal.jpg

In the code, you do not write public. You start the path at /img/ because React serves the public folder as the website root.

Example

File location on your computer:
public/img/tracks/redbullring.jpg

Path used in the code:
href="/img/tracks/redbullring.jpg"

7. Simple checklist after changing a track image

1. Save the file in VS Code.
2. Start the site with npm start.
3. Open Race Centre on laptop size.
4. Press the Track button. Confirm the correct track image opens.
5. Open mobile view or check on your phone.
6. Press the Track button again. Confirm the same correct image opens.
7. If one works and the other does not, you changed only one section. Check both mobile and laptop Track buttons.

8. Common mistakes

- Using redbull.jpg in one section and redbullring.jpg in another section.

- Changing the laptop section but forgetting the mobile section.
- Putting the image in src instead of public/img/tracks. For a simple href image path, use the public folder.
- Typing the path with a capital letter when the file name uses lowercase. File names should match exactly.
- Changing the Photo Gallery href by accident instead of the Track href.

9. Photo Gallery button note

The Photo Gallery button should usually jump down the page to the race gallery section, not open the track image.

href="#race-gallery"

If your mobile Photo Gallery button uses /img/tracks/redbull.jpg, it is wrong. Change it to #race-gallery so it matches the laptop/desktop button.
